## Methods

- Karyotyping
- FISH
- Array

# Bridging the Gaps: Short/Long/Mapping

## Sequencing lengths available

NGS Single End (50–300, Illumina)

NGS Paired End (2\*75–300, total 150–600bp, Illumina)

Long Read (>10 000, no fixed upper limit)

## Assembling genome *de novo*

(A) Correct assembly with short reads

(B) Uneven coverage results in missing regions

(C) Repetitive regions can erroneously be collapsed

(D) Paired-end reads anchor repetitive sequences in unique flanking regions, providing the insert size is sufficient insert

(E) Long reads bridge regions, high error-rates

(F) Short reads can correct base calls of long reads

# Sequencing 4.0: Genome mapping technology

## Dovetail Genomics

- Hi-c technique + NGS short-read PE

# Sequencing 4.0: Genome mapping technology

## Bionano system

### Structural variants (SVs): CBA

**Unbalanced translocation** (insertions, inversions and translocations):

Chromosomal microarray analysis (CMA)

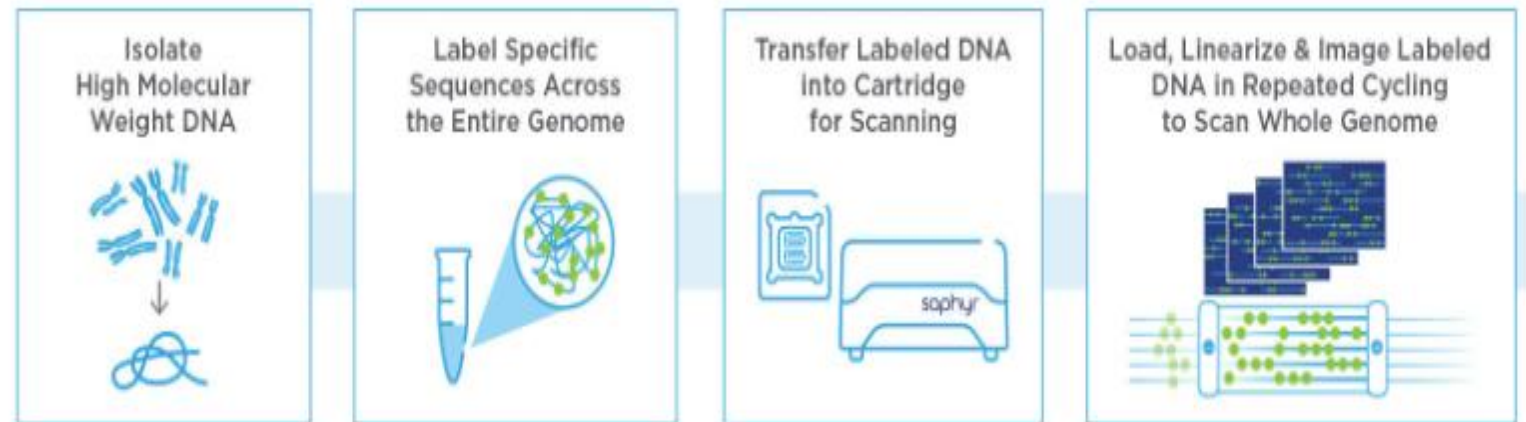

Whole genome sequencing (WGS)

limitation: technical/computational challenges

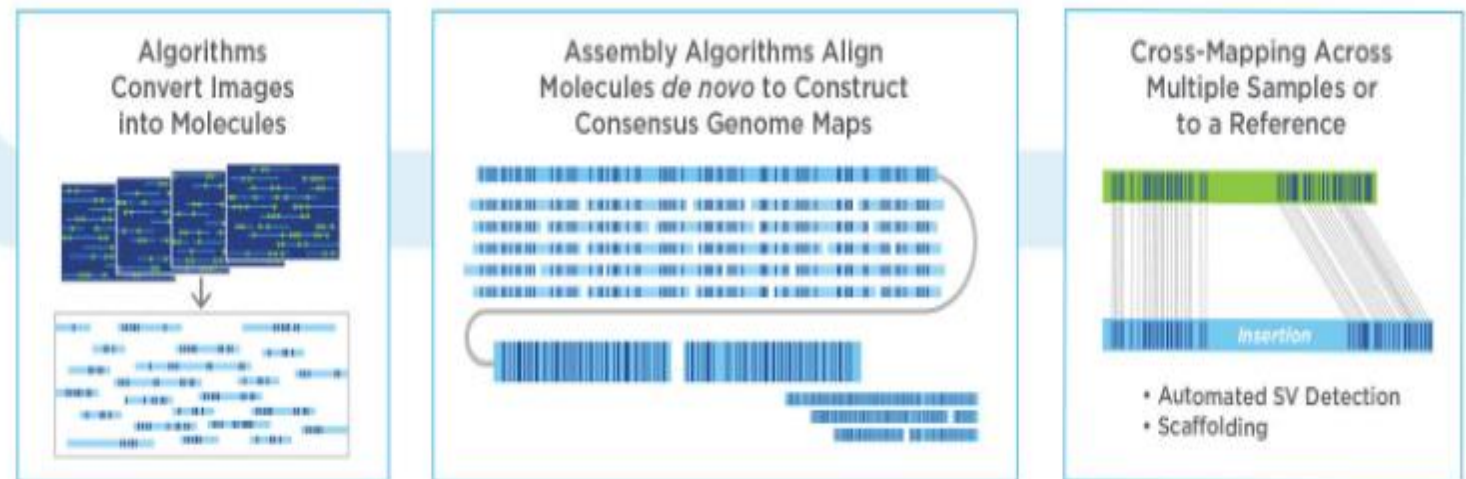

**Balanced translocation (CNV):**

Whole genome sequencing (WGS)

limitation: technical/computational challenges

### High-throughput, High-resolution Imaging of Megabase Length Molecules

# Considerations: NGS

## Interpretation

- Incidental finding
- Variant of uncertain significance (VoUS)

A microscopic image showing several blue-stained chromosomes. The chromosomes are arranged in a circular pattern, with some appearing as single X-shaped structures and others as more complex, intertwined forms. The background is a light, slightly textured surface.

**Thank you**
